EXECUTIVE SUMMARY

Presented in this report are the results of the fourteenth quarterly groundwater sampling event (March-April 2000) completed as part of a long-term quarterly groundwater monitoring program at the NASA-Jet Propulsion Laboratory (JPL). This sampling event was conducted from March 6 through April 3, 2000.

During this event, groundwater samples were collected from JPL monitoring wells (both on- and off-site) and analyzed for volatile organic compounds (VOCs), total chromium (Cr), hexavalent chromium [Cr(VI)], and perchlorate (ClO_4^-).

Results indicate that only three VOCs (carbon tetrachloride, trichloroethene, and tetrachloroethene) were detected at concentrations above state or Federal Maximum Contaminant Levels (MCLs) for drinking water. In addition, perchlorate was detected at concentrations exceeding the state Interim Action Level (IAL) of 18 $\mu\text{g/L}$. Hexavalent chromium was found in two wells. To date, an MCL has not been established for hexavalent chromium. Total chromium was detected in four wells. The concentration in one well exceeded the state (0.050 mg/L), but not the Federal MCL (0.100 mg/L). A summary of the sampling procedures is included in Section 2.0, and analytical results are presented in Section 3.0.

In the past, general groundwater parameters (major cations/anions) were monitored quarterly to determine general groundwater types and distribution beneath and adjacent to JPL. However, because groundwater chemistry beneath JPL is now well understood, major cation/anion analysis was not conducted during this event, but will be conducted annually.

Water-level elevations were measured before and after sampling activities to determine groundwater gradients and flow directions present during sampling. Water-level measurements are presented in Section 4.0. Groundwater flow was observed to be primarily to the south and east across JPL, with a zone of depression in the water table around the nearby operating City of Pasadena municipal production wells.

1.0 INTRODUCTION

This report summarizes the results from the fourteenth groundwater sampling event completed as part of the Long-Term Quarterly Monitoring Program currently being conducted at the NASA-Jet Propulsion Laboratory (JPL). The Long-Term Quarterly Monitoring Program was initiated in 1996 in response to a request from the United States Environmental Protection Agency (EPA). The program began during the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Remedial Investigation for on-site and off-site groundwater at JPL. The purpose of the program is to monitor the elevation, flow direction, and quality of the groundwater beneath and adjacent to the JPL site.

From March 9 to March 31, 2000, Foster Wheeler Environmental Corporation (Foster Wheeler) personnel collected samples from on- and off-site JPL monitoring wells. In addition, the water-level elevation at each well was measured prior to (March 6 & 8, 2000), and after (April 3, 2000) sampling to evaluate groundwater flow directions and gradients.

The locations of the JPL groundwater monitoring wells are shown in Figure 1-1. Monitoring wells MW-3, MW-4, MW-11, MW-12, MW-14, and MW-17 through MW-24 are deep multi-port wells, each containing five screened intervals equipped with a Westbay Instruments, Inc. (Westbay) multi-port casing system. Monitoring wells MW-1, MW-5, MW-6, MW-7, MW-8, MW-9, MW-10, MW-13, MW-15, and MW-16 are relatively shallow standpipe wells, each containing a single screened interval located just below the water table. Monitoring well MW-2 was not sampled since it was replaced with well MW-14 (Figure 1-1) as a JPL sampling point. A summary of the well construction details for the JPL groundwater monitoring wells is included in Table 1-1.

Based on the approved Long-Term Quarterly Monitoring Program Plan (Foster Wheeler, 1996) and on results from the first two years of monitoring at JPL, the monitoring program was revised to improve monitoring efficiency. Following regulatory agency approval [U.S. Environmental Protection Agency (EPA), California Department of Toxic Substances Control (DTSC), and the Regional Water Quality Control Board (RWQCB)], the changes were first implemented during the August, 1999 Monitoring Event (Foster Wheeler, 1999a). Basically, the changes are specific to each event, and involve less frequent sampling of wells/screens (monitoring points) in which various JPL constituents of interest are not present. In addition, general groundwater parameters (major anions and cations), which had been monitored quarterly in the past to delineate groundwater types beneath the site, are now monitored annually. The changes are discussed in detail in the second and third Long-Term Quarterly Monitoring Program Annual Reports (Foster Wheeler, 1999b and 2000).

In accordance with these changes, the March-April 2000 event involved sampling of selected JPL monitoring points determined to be required to adequately monitor the JPL constituents of interest [volatile organic compounds (VOCs), total chromium (Cr), hexavalent chromium [Cr(VI)], and perchlorate (ClO_4^-)]. A summary of monitoring points sampled and analyses performed is presented in Table 1-2.

All groundwater samples were taken to Montgomery Watson Laboratories in Pasadena, California, for chemical analysis. Montgomery Watson Laboratories is certified by the California Department of Health Services (CADHS).

In addition to groundwater samples, field quality assurance/quality control (QA/QC) samples, including trip blanks, equipment blanks, duplicate samples, and a field blank were collected for laboratory analysis. Sampling records for each shallow well are included in Appendix A, and sampling records and piezometric pressure profiling records for each deep multi-port well are included in Appendix B. Field instrument calibration forms are included in Appendix C, and laboratory analytical reports and associated chain-of-custody forms are included in Appendix D.

2.0 SAMPLING AND FIELD QUALITY ASSURANCE/ QUALITY CONTROL PROCEDURES

Two different procedures were used in collection of groundwater samples at JPL, one designed for the shallow wells and the other for the deep multi-port wells. These procedures are outlined below.

2.1 SHALLOW MONITORING WELLS

The sampling procedure described below was applied to the shallow JPL monitoring wells sampled during this event. This includes monitoring wells MW-5, MW-6, MW-7, MW-8, MW-10, MW-13, and MW-16.

The primary equipment used to sample the shallow wells included dedicated 2-inch Grundfos Redi-Flo²® pumps, a pump controller, and a 220-volt generator. All of the dedicated 2-inch Grundfos Redi-Flo²® pump systems were decontaminated prior to their installation before the beginning of the long-term quarterly monitoring program. Details of the decontamination procedures for the Grundfos Redi-Flo²® pump systems are outlined in a previous document (Ebasco, 1993a).

Prior to sample collection, the water in each shallow well casing was purged (by pumping) to remove groundwater that may have been exposed to the atmosphere and thus may not be representative of undisturbed aquifer conditions. This purged groundwater was discharged into 500- or 1,000-gallon polyethylene storage tanks for disposal by JPL personnel pursuant to EPA guidance (EPA, 1991 and 1992).

Temperature, pH, electrical conductivity, and turbidity of the water removed from each well were monitored during purging. After these parameters had stabilized (when two successive measurements made approximately 3 minutes apart were within 10 percent of each other) and the turbidity was less than 5 Nephelometric Turbidity Units, the groundwater samples were collected with the dedicated pump. During sampling for VOCs, the pump rate was reduced to approximately 0.02 gallons per minute to minimize sample agitation. All information concerning sampling was noted on the Well Development/Well Sampling Log forms included in Appendix A.

All sample bottles were filled completely (though not allowed to overflow), capped, labeled, and placed in a cooler with ice immediately thereafter. Samples collected for VOCs had zero headspace.

Calibration, or standardization, of the field instruments used to measure temperature, pH, electrical conductivity, and turbidity, was performed to the manufacturer's specifications at the beginning and end of each sampling day. Field instrument calibration forms are included in Appendix C.

2.2 DEEP MULTI-PORT MONITORING WELLS

Sampling of the deep multi-port monitoring wells at JPL required specialized sampling equipment manufactured by Westbay. This equipment included a pressure profiling/sampling probe with a surface control unit. Field personnel using this equipment were trained by Westbay personnel to ensure proper use. Copies of the detailed operations manuals for the Westbay pressure profiling/sampling probe are included in the OU-1 and OU-3 Field Sampling and Analysis Plans (Ebasco, 1993a and 1994).

The Westbay sampling probe and sample-collection bottles were decontaminated prior to sampling each screened interval in the deep multi-port wells according to the following procedures:

- Wash each 250-mL stainless-steel sample-collection bottle in a solution of non-phosphate detergent (Liquinox®) and distilled water followed by washing each bottle in a solution of an acidic detergent (Citranox®) and American Society of Testing Materials (ASTM) Type II (deionized) water.
- Rinse each bottle with ASTM Type II water.
- The interior surfaces of the Westbay sampling probe, and the hoses and valves associated with the Westbay sample bottles, were decontaminated by forcing several volumes of a solution of Liquinox® and distilled water through them followed by forcing several volumes of a Citranox® and ASTM Type II water solution through them. A final rinse with ASTM Type II water was carried out. Each of these decontamination procedures was completed using a clean plastic spray bottle used only for this purpose.

Purging before sampling is not required in the deep multi-port monitoring wells because the groundwater sample is collected directly from the aquifer, thus ensuring that the groundwater sample has not been exposed to the atmosphere. However, at each screened interval an initial sample was collected in order to check temperature, pH, electrical conductivity, and turbidity in the field, and to rinse the Westbay stainless-steel sample-collection bottles with formation water. Samples for laboratory analysis were then collected and transferred to sample containers as described in Section 2.1. A final sample was then collected and the temperature, pH, electrical conductivity, and turbidity were measured to ensure continuity of aquifer conditions during sampling. Results of the field analyses were recorded on well development logs, which are included in Appendix B. Calibration of field instruments was carried out according to procedures described previously (Ebasco, 1993a and 1994).

2.3 FIELD QUALITY ASSURANCE/QUALITY CONTROL SAMPLES

To verify the quality of the groundwater samples collected from the JPL monitoring wells, field QA/QC samples were collected. The field QA/QC program included the collection of duplicate samples, equipment blanks, trip blanks, and a field blank. In addition, laboratory QA/QC samples were used by the laboratory according to analytical method requirements.

Duplicate samples for VOCs, Cr(VI), total Cr, and ClO₄⁻ analyses were collected from shallow groundwater monitoring wells MW-10 and MW-13, and deep multi-port monitoring wells MW-4 (Screen 2) and MW-12 (Screen 2). In addition, after every 10 samples that were collected for VOC analyses, a matrix-spike (MS) sample and a matrix-spike-duplicate (MSD) sample were collected and submitted to the laboratory for use in verifying the accuracy of the analytical method. Similarly, after every 10 samples that were collected for total chromium analyses, an MS/MSD sample was collected and submitted to the laboratory for analytical method verification. A QC sample for hexavalent chromium was submitted for each day that samples were collected for hexavalent chromium.

One equipment blank was collected from the Westbay sample collection bottles during each day of sampling of the deep multi-port wells. Equipment blanks consisted of ASTM Type II water (provided by the laboratory), which had been passed through the sampling equipment after the equipment had been decontaminated. Equipment blanks were analyzed for the same constituents as the groundwater samples to identify potential cross contamination due to inadequate decontamination procedures. Equipment blanks were not collected during sampling of the shallow wells as dedicated sampling equipment was used.

A trip blank, consisting of ASTM Type II water placed in two 40-mL glass vials by the laboratory, was transported with the empty sample bottles to the field and back to the laboratory with the groundwater samples. One trip blank was submitted for VOC analysis with each shipment of groundwater samples to the laboratory. Trip blanks were used to identify potential cross contamination of groundwater samples during transport.

During this sampling event, one field blank was collected at monitoring well MW-7. The field blank is used to determine whether ambient conditions or sample containers may effect analytical results. The field blank consisted of sample bottles, filled with ASTM Type II water supplied by the laboratory, left open at the well head during the sampling of the well. After sampling, the bottles containing the field blank were capped and analyzed for the same constituents as the groundwater samples.

3.0 ANALYTICAL RESULTS

JPL groundwater monitoring wells MW-3 through MW-8, MW-10 through MW-14, and MW-16 through MW-24 were sampled from March 9 to March 31, 2000. Monitoring well MW-2 is not included in the monitoring program, as it was replaced as a JPL monitoring point by deep multi-port monitoring well MW-14. Samples were not collected from MW-1, MW-3 (Screen 1), MW-9, MW-11 (Screen 5), MW-15, MW-17 (Screen 1), MW-18 (Screen 1), MW-22 (Screen 5), and MW-24 (Screen 5) due to approved changes in the sampling program (these wells are either upgradient or sufficiently far downgradient of detected contaminants of concern, and will be sampled semi-annually).

The groundwater samples collected during this sampling event were analyzed for VOCs, total Cr, Cr(VI), and ClO_4^- . Refer to Table 1-2 for a summary of the samples collected, sample numbers used, and the analyses performed. Analytical laboratory reports and associated chain-of-custody forms are included in Appendix D.

3.1 VOLATILE ORGANIC COMPOUNDS RESULTS

Groundwater samples collected during the March-April 2000 sampling event were analyzed for over 60 different VOCs in accordance with EPA Method 524.2. Results of the analyses for VOCs in the March-April 2000 samples are summarized in Table 3-1 along with the Maximum Contaminant Levels (MCLs) for drinking water as listed in Title 22 of the California Code of Regulations and in EPA Health Advisory Guidelines. Few VOCs were detected in the JPL samples, and only three VOCs [carbon tetrachloride (CCl_4), trichloroethene (TCE), and tetrachloroethene (PCE)] were found in concentrations exceeding state and/or Federal MCLs (Table 3-1).

At the request of the regulatory agencies, the aquifer beneath the site was divided into layers for data presentation purposes, based primarily on correlations interpreted from lithologic cross sections and from hydrologic characteristics. Listed in Table 3-2 are the JPL monitoring well screens and their corresponding aquifer layers. The concentrations of CCl_4 , TCE, and PCE detected in each aquifer layer are contoured on site maps to show the spatial distribution of each constituent. A map for each of the above-mentioned VOCs was prepared for each aquifer layer in which it was detected. For instances where a constituent was not detected or only detected once in a particular aquifer layer, a contour map was not prepared for that constituent in that particular layer. Carbon tetrachloride concentrations detected in Aquifer Layers 1, 2, and 3 are contoured in Figures 3-1, 3-2, and 3-3, respectively. Figures 3-4, 3-5, and 3-6 display contours of TCE concentrations detected in Layers 1, 2, and 3, respectively. Figures 3-7, 3-8, and 3-9 show contours of PCE detected in Aquifer Layers 1, 2, and 3. A summary of the VOC results compiled from all fourteen long-term quarterly sampling events completed to date is provided in Table 3-3.

CCl_4 above the state MCL (0.5 $\mu\text{g/L}$) was found in eight on-site wells and one off-site well (Table 3-1, Figures 3-1, 3-2, and 3-3). The Federal MCL (5.0 $\mu\text{g/L}$) was exceeded in six on-site wells. The highest concentrations of CCl_4 were found in on-site wells MW-3 (Screen 3), MW-7, MW-12 (Screen 3), MW-13, MW-16, and MW-24 (Screens 1 and 2).

TCE concentrations exceeded the state and Federal MCL (5.0 $\mu\text{g/L}$) in three on-site wells and two off-site wells (Table 3-1, Figures 3-4, 3-5, and 3-6). The highest levels of TCE were found in on-site wells MW-7, MW-13, and off-site well MW-21 (Screen 1).

1,2-DCA was detected in one on-site well (MW-7) at its state MCL (0.5 $\mu\text{g/L}$) (Table 3-1), and was not detected in any off-site well. The Federal MCL for 1,2-DCA (5.0 $\mu\text{g/L}$) was not exceeded in any well.

PCE was detected at low levels in several on-site and off-site wells (Table 3-1, Figures 3-7, 3-8, and 3-9). The state and Federal MCL (5.0 $\mu\text{g/L}$) was exceeded only in off-site well MW-21 (Screen 5).

3.2 PERCHLORATE RESULTS

Perchlorate analyses were conducted on groundwater samples from the March-April 2000 event using ion chromatography (CADHS/EPA 314). Results are included in Table 3-1. No MCLs for ClO_4^- have been established to date. However, the California Department of Health Services has established an Interim Action Level (IAL) of 18 $\mu\text{g/L}$ for ClO_4^- . Perchlorate was detected in a total of 17 wells (Table 3-1). Concentrations in seven of the 17 wells exceeded the Interim Action Level (18 $\mu\text{g/L}$). Perchlorate concentrations are contoured in Figures 3-10, 3-11, and 3-12 for Aquifer Layers 1, 2, and 3, respectively. The highest ClO_4^- levels were observed on-site in wells MW-4 (Screen 2), MW-7, MW-13, MW-16, and MW-24 (Screens 1 and 2).

3.3 CHROMIUM RESULTS

Groundwater samples were analyzed for total Cr (EPA 200.8) and Cr(VI) [(EPA 7196)]. The results of these analyses for the March-April 2000 samples are summarized below and in Table 3-4.

Total Cr was detected in four wells, MW-6, MW-7, MW-10, and MW-13. All had concentrations below the Federal drinking water standard (0.100 mg/L), and all but MW-6 were below the state drinking water standard (0.05 mg/L). Hexavalent chromium was detected in two on-site shallow wells, MW-7 and MW-13. At this time, neither state nor Federal agencies have established an MCL for Cr(VI).

Table 3-5 contains a summary of metals data from all fourteen quarterly sampling events completed to date during the long-term monitoring program.

3.4 QUALITY ASSURANCE/QUALITY CONTROL RESULTS

Review of the QA/QC data provided with the laboratory analytical results (Appendix D) indicates that results obtained from the March-April 2000 sampling event are acceptable for their intended use of characterizing aquifer quality. Surrogate compound, matrix and blank spike, and method blank results were used by the laboratory to determine the accuracy and precision of the analytical techniques with respect to the JPL groundwater matrix, and to identify anomalous results due to laboratory contamination or instrument malfunction.

In addition to laboratory QA/QC samples, Foster Wheeler personnel collected QA/QC samples in the field. These samples included duplicate samples, equipment blanks, trip blanks, and a field blank.

Duplicate samples were used to evaluate the precision of the laboratory analyses. Duplicate groundwater samples were collected from MW-4 (Screen 2), MW-10, MW-12 (Screen 2), and MW-13, and analyzed for VOCs, ClO_4^- , total Cr, and Cr(VI). All of the analytical results for the duplicate samples were similar to the results of the original groundwater samples (Table 3-1 and Table 3-4).

Thirteen equipment blanks and sixteen trip blanks were submitted for analysis during the March-April 2000 sampling event. Chloroform was detected at very low levels (<2.2 $\mu\text{g/L}$) in the field blank and all equipment blanks. Some groundwater samples associated with these blanks also had detectable concentrations of chloroform, but were well below state and Federal drinking water standards (100 $\mu\text{g/L}$) (Tables 3-1 and 3-3). This has occurred in some previous sampling events. It is suspected that very low levels of chloroform were likely present in the deionized water used for the field and equipment blanks.

4.0 WATER-LEVEL MEASUREMENTS

Water-level measurements were recorded before sampling, on March 6 & 8, 2000, and after sampling, on April 3, 2000, to evaluate groundwater flow directions and gradients beneath and adjacent to JPL. Water-level data in the shallow wells were collected using a Solinst® water-level meter that utilized a water-sensor probe attached to a measuring tape. As the probe was lowered into a well, contact with the groundwater completed a circuit between two electrodes in the probe, thus activating a sounding device attached to a reel at the surface. Depth to groundwater was then read directly from the measuring tape at the top of the well casing.

In the deep multi-port wells, the hydraulic head at each sampling port in each screened interval was measured with a pressure-transducer probe manufactured by Westbay specifically for the unique casing used in these wells.

Water-table elevation measurements taken before sampling are provided in Table 4-1, and have been contoured in Figure 4-1. Water-table elevation measurements taken after sampling are provided in Table 4-2, and have been contoured in Figure 4-2. The hydraulic heads measured at each deep multi-port well screen before and after sampling are presented graphically in Figures 4-3 and 4-4, respectively. The pressure-profile records for the deep wells are included in Appendix B.

As indicated by Figures 4-1 and 4-2, groundwater flow was primarily to the south and east across JPL both before and after sampling. The “trough” of depression observed around the City of Pasadena municipal production wells (Figures 4-1 and 4-2) is the result of active pumping by these wells throughout this sampling event. This is also indicated by data shown in Figures 4-3 and 4-4 where the effects of municipal well pumping are reflected by relatively large drawdowns in the hydraulic heads measured at the lowermost screens within the multi-port wells closest to the production wells (MW-3, -4, -11, -12, -17, and -19).

--: Not detected.

DUP: Duplicate.

NE: Not established.

1: Monitoring point not sampled for the particular constituent(s) due to changes in the sampling program as agreed to by the EPA, DTSC, and RWQCB.

2: California Department of Health Services Interim Action Level.

a: Only VOCs for which MCLs have been established are listed.

EB: Compound detected in associated equipment blank.

FB: Compound detected in associated field blank.

--: Not detected.

B: Compound detected in laboratory method blank.

EB: Compound detected in associated equipment blank.

RT: Retention time.

TB: Compound detected in associated trip blank.

FB: Compound detected in associated field blank.

E: Estimated concentration; result exceeded calibration range.

NE: Not established.

1: Perchlorate not part of monitoring program.

2: Monitoring point not sampled for the particular constituent due to changes in the sampling program as agreed to by the EPA, DTSC, and RWQCB.

3: All the equipment blanks for the round had chloroform concentrations ranging from 0.8 to 2.9 µg/L. The ASTM Type II water used for the equipment blanks is the probable source of the chloroform.

4: Suspected by the laboratory to have resulted from carry over in analysis (see January/February 1998 report).

5: Attributed to laboratory contamination.

6: Results from duplicate analysis; original sample was non detect.

7: Not sampled, no water over screen.

8: Not sampled due to mechanical failure.

9: Wells installed June-August 1997.

10: Only VOCs for which MCLs have been established are listed.

11: California Department of Health Services Interim Action Level.

EPA Maximum Contaminant Level		0.05	(7)	0.10	NE	

--: Not detected.

NS: Not sampled.

NE: Not established.

- 1: Probable lab error. MW-1 is always upgradient of the site, and Cr contamination is not believed to be present upgradient of the site.
- 2: Monitoring point not sampled for the particular constituent due to changes in the sampling program as agreed to by the EPA, DTSC, and RWQCB.
- 3: Believed to be a laboratory error.
- 4: Not sampled, no water over screen.
- 5: Not sampled due to mechanical failure.
- 6: Wells installed June-August 1997.
- 7: Treatment technique and public notification triggered at Action Level of 0.015 mg/L.
- 8: Turbidity not measured due to equipment failure.

APPENDIX A

WELL DEVELOPMENT/WELL SAMPLING LOG FORMS FOR SHALLOW WELLS

WELL DEVELOPMENT LOG / WELL SAMPLING LOG

Project Name : JPL
Project Number : 1572, 0305
Date : 3-31-00
Site Engineer : A. Hutz, V. Richter

Well Number : MW-5
Equipment : Solfenit ; 2" Grundfos
H.F. Screened - Diffusee ysc-3500
Contractor : None

	Before	Reference Point	After
Depth to Water (ft)	72.00	Top of 4" Casing	72.00
Depth to Sediment (ft)	139.86	Top of 4" Casing	139.86
Thickness of Sediment (ft)	0.14		0.14
Depth of Well (ft)	140.00		
Diameter of Casing (ft)	0.333		
Water Column Height (ft)	67.9		
Casing Volume (gals) =		$\pi(\text{Diam. of Casing (ft)/2})^2 (\text{Water Column Height (ft)})(7.48 \text{ gals/ft}^3) =$	44.2
Total Volume Purged (gals)	141	Casing Volumes Purged	3.2

Notes Sampling Procedures: Pump @ 100' RTD@

WELL DEVELOPMENT LOG / WELL SAMPLING LOG

Project Name : JPL
Project Number : 1572.0305
Date : 3-24-00
Site Engineer : M. Hunt, V. Richards, M. Flan

Well Number : MW-6
Equipment : Solinst, YSI 3500, DRE-15CE
2" Grundfos pump
Contractor : None

	<i>Before</i>	<i>Reference Point</i>	<i>After</i>
Depth to Water (ft)	<u>191.02</u>	<u>Top of 4" Casing</u>	<u>191.02</u>
Depth to Sediment (ft)	<u>244.00</u>	<u>Top of 4" Casing</u>	<u>244.00</u>
Thickness of Sediment (ft)	<u>1.00</u>		<u>1.00</u>
Depth of Well (ft)	<u>245.00</u>		
Diameter of Casing (ft)	<u>0.333</u>		
Water Column Height (ft)	<u>53.0</u>		
Casing Volume (gals) =		$\pi(\text{Diam. of Casing (ft)/2})^2 (\text{Water Column Height (ft)})(7.48 \text{ gals/ft}^3) =$	<u>34.5</u>
Total Volume Purged (gals)	<u>120</u>	Casing Volumes Purged	<u>3.5</u>

Notes Sampling Procedures: Pump set at 240° BTOC

WELL DEVELOPMENT LOG / WELL SAMPLING LOG

Project Name : JPL
Project Number : 1572 . 0305
Date : 3-24-00
Site Engineer : M. Hunt, V. Richards, M. Flores

Well Number : MW-7
Equipment : Solinst - 2" Grundfos Pump
HF sewer. Ac DNT-1500; JSI 3500
Contractor : None

	<i>Before</i>	<i>Reference Point</i>	<i>After</i>			
Depth to Water (ft)	220.10	<u>Top of 4" Casing</u>	220.10

WELL DEVELOPMENT LOG / WELL SAMPLING LOG

Project Name : JPL
 Project Number : 1572.0305
 Date : 3-17-00
 Site Engineer : M. Hunt, V. Richards, M. Flores

Well Number : MW-22
 Equipment : YSI - 350
HF. Scientific - DRT-15
 Contractor : None

	Before	Reference Point	After			
Depth to Water (ft)	<u>* see pressure profile sheets</u>					
Depth to Sediment (ft)						
Thickness of Sediment (ft)						
Depth of Well (ft)						
Diameter of Casing (ft)						
Water Column Height (ft)						
Casing Volume (gals) =	$\pi(\text{Diam. of Casing (ft)/2})^2 (\text{Water Column Height (ft)})(7.48 \text{ gals/ft}^3) =$					
Total Volume Purged (gals)		Casing Volumes Purged				
Time	pH	Turbidity (NTU)	Temp. (°C)	Conductivity (μmhos)	Pump Rate (gpm)	Comments
0935	7.51	1.94	19.9	324	—	1st run screen 4; initial parameters
1000	7.39	2.44	20.5	320	—	2nd Run; collect MW-001-010; final parameters
—	—	—	—	—	—	—
1025	7.56	3.24	21.0	428	—	1st run screen 3; initial parameters
1050	7.72	6.01	20.6	450	—	2nd Run screen 3; collect MW-001-011; final parameters
—	—	—	—	—	—	—
1115	7.74	0.53	20.7	550	—	1st run screen 2; initial parameters
1135	7.65	0.75	23.1	614	—	2nd Run; collected MW-001-012; final parameters
—	—	—	—	—	—	—
1202	7.48	16.70	22.7	1150	—	1st Run screen 1; initial parameters
1220	7.41	15.82	23.0	1154	—	2nd Run; parameters
1240	7.43	16.01	23.3	1157	—	3rd Run; parameters
1300	7.36	15.50	27.3	1184	—	4th Run; collect MW-001-013; final parameters
Notes Sampling Procedures:
